

Resilient Tile Care

1 Check your floors regularly for a good base. In a well-lit area, look down at the tile. If there is no depth to the finish and scuff and black marks are becoming hard to remove, a recoat is due.

7 Move scrubber to where you will start. Scrub area slowly with full pad pressure, solution valve 3/4 open, squeegee down and vacuum motor on.

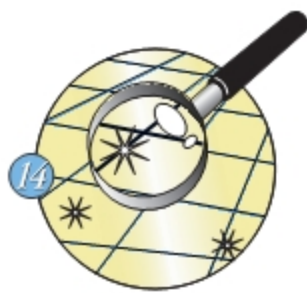

13 Move to next area to be scrubbed and repeat steps 6-12.

2 Vacuum or shake out walk-off mats. Replace mats as needed. The more dirt you stop at the entrances, the longer the floor finish will last and maintain a higher appearance level.

8 Pick up water missed by the scrubber and rinse the entire area with a clean rinse mop. As rinse water becomes dirty, change it.

14 Make sure the floor is clean. If not, rescrub and rinse until clean.

3 Remove all displays & fixtures from floor area. Dust mop to remove all loose soil being sure to reach under the counters.

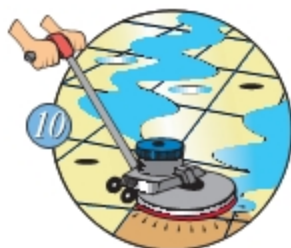

9 If automatic scrubber is not available, liberally apply all purpose solution with mop.

15 Recoat ONLY after scrubbing and rinsing. Make sure all dirt & black marks are removed.

4 Use a scraper and gum remover to remove gum and other attached soil deposits.

10 Scrub with circular scrubber equipped with a red pad.

16 When floor has dried, apply 1 or 2 thin coats of finish. Slay approximately 6 inches from edges.

5 Check all equipment, making sure it is clean. If not, clean & repair before using.

11 Pick up solution with a wet/dry vacuum or mop.

17 Allow finish approximately 24 hours cure before resuming daily maintenance procedures.

6 According to label directions, mix all purpose cleaner in solution tank.

12 Do one area at a time and never leave a wet floor unattended.

18 After all areas have been scrubbed and recoated, return all equipment to stop sink area for cleaning and storage.
